

TxID Support

Clarity in every transaction.

The brand and design system for the support layer protocols embed into their products — built to read as precise, calm, and trustworthy, never degen.

VERSION1.0

UPDATEDJun 2026

THEMEDark-First

01 — FOUNDATION

The positioning

TxID Support is the AI support agent protocols embed to diagnose transaction issues and resurface project information for their users. It sits inside someone else's product, so it has to earn trust instantly — feel like engineering-grade infrastructure, not a hype project.

Trustworthy

Reads as audited infrastructure.

Precise

Exact, technical, never vague.

Calm

Composed when things break.

Embedded

Quietly fits any host brand.

WE ARE

Infrastructure-grade and measured
Plain-spoken about what went wrong
Visually restrained — content leads

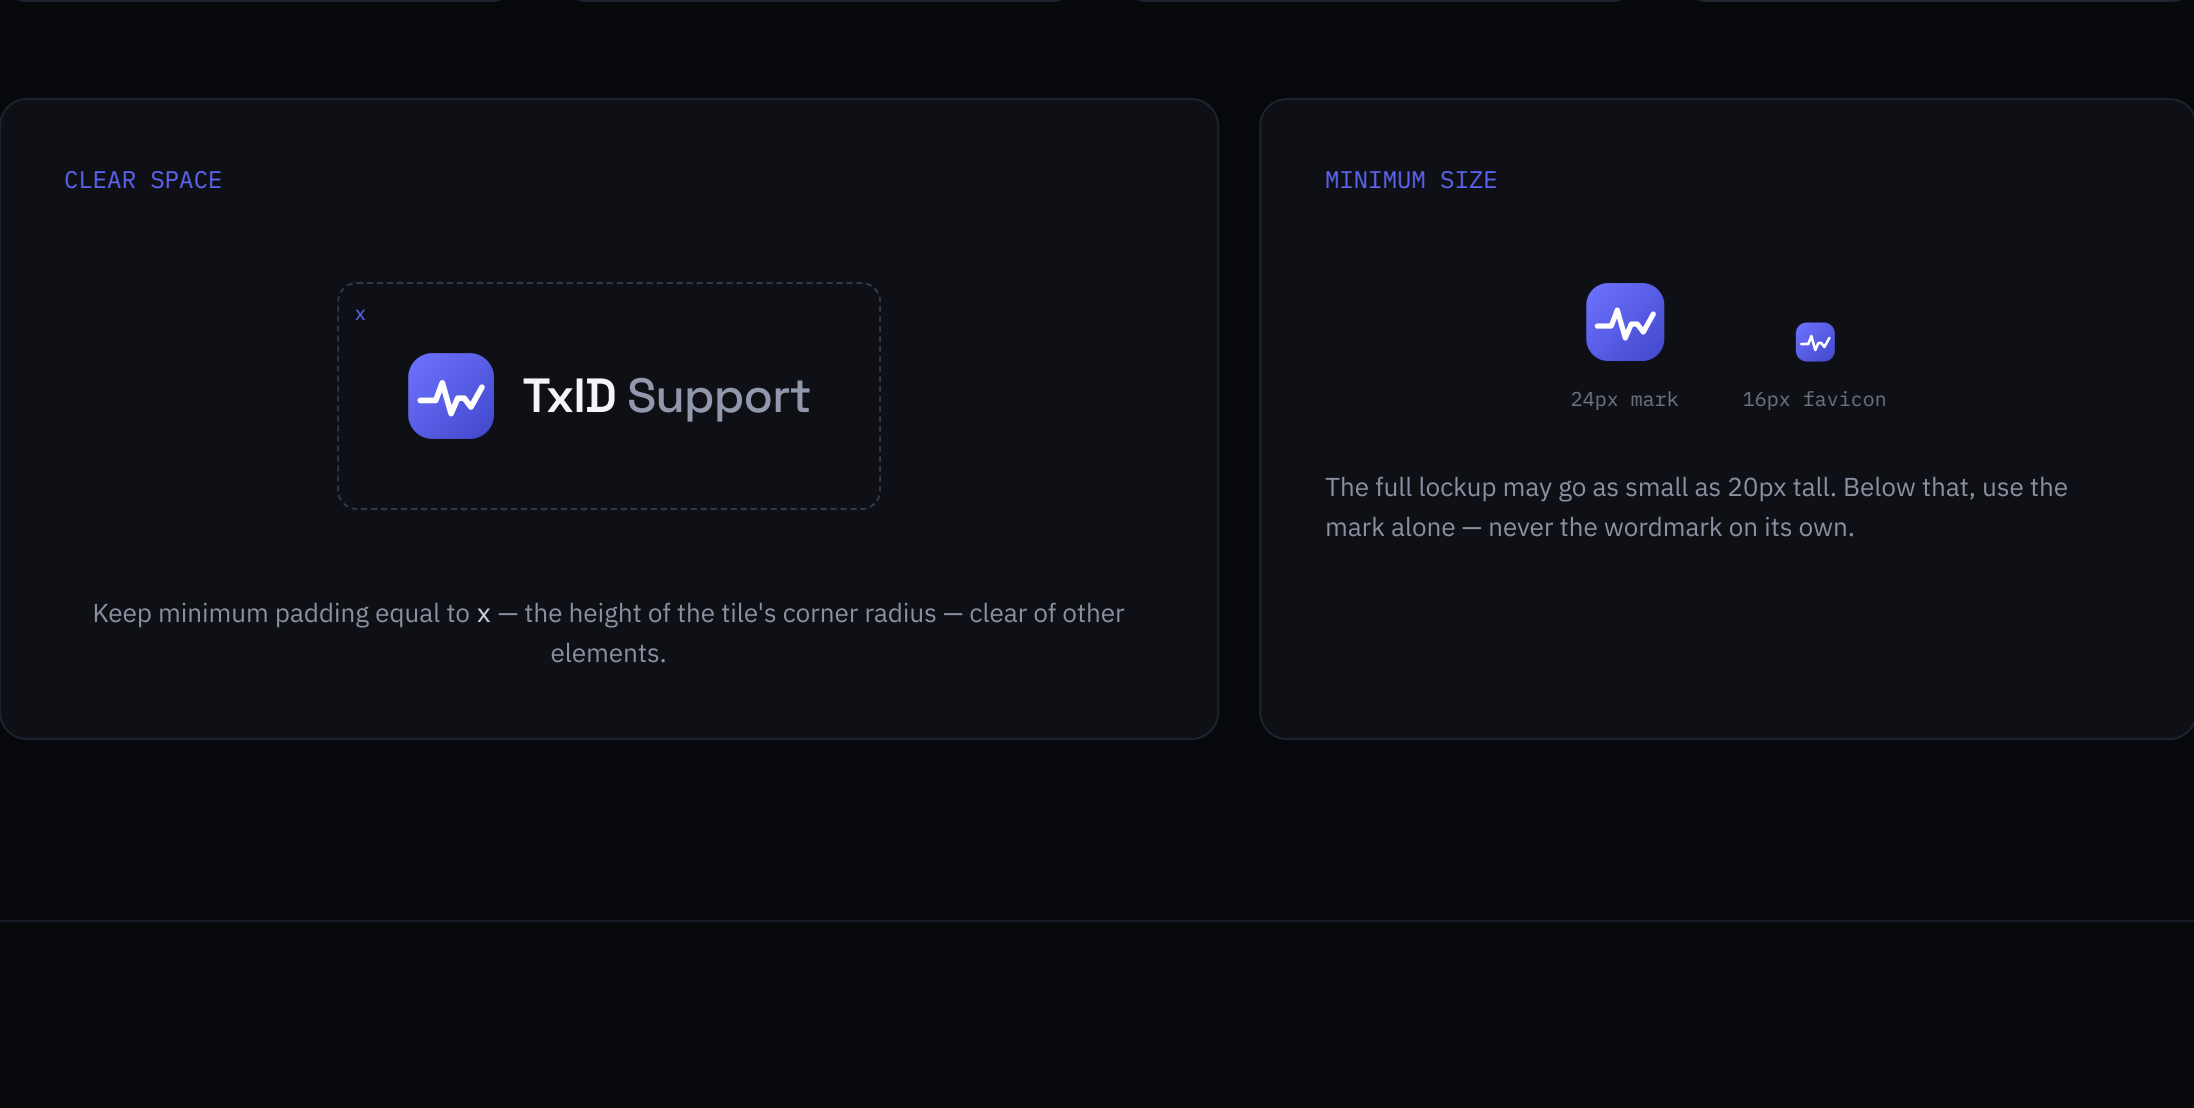

WE ARE NOT

Hype-driven or meme-y ("gm ser")
Neon gradients and glowing everything
Emoji-heavy or over-familiar

02 — LOGO

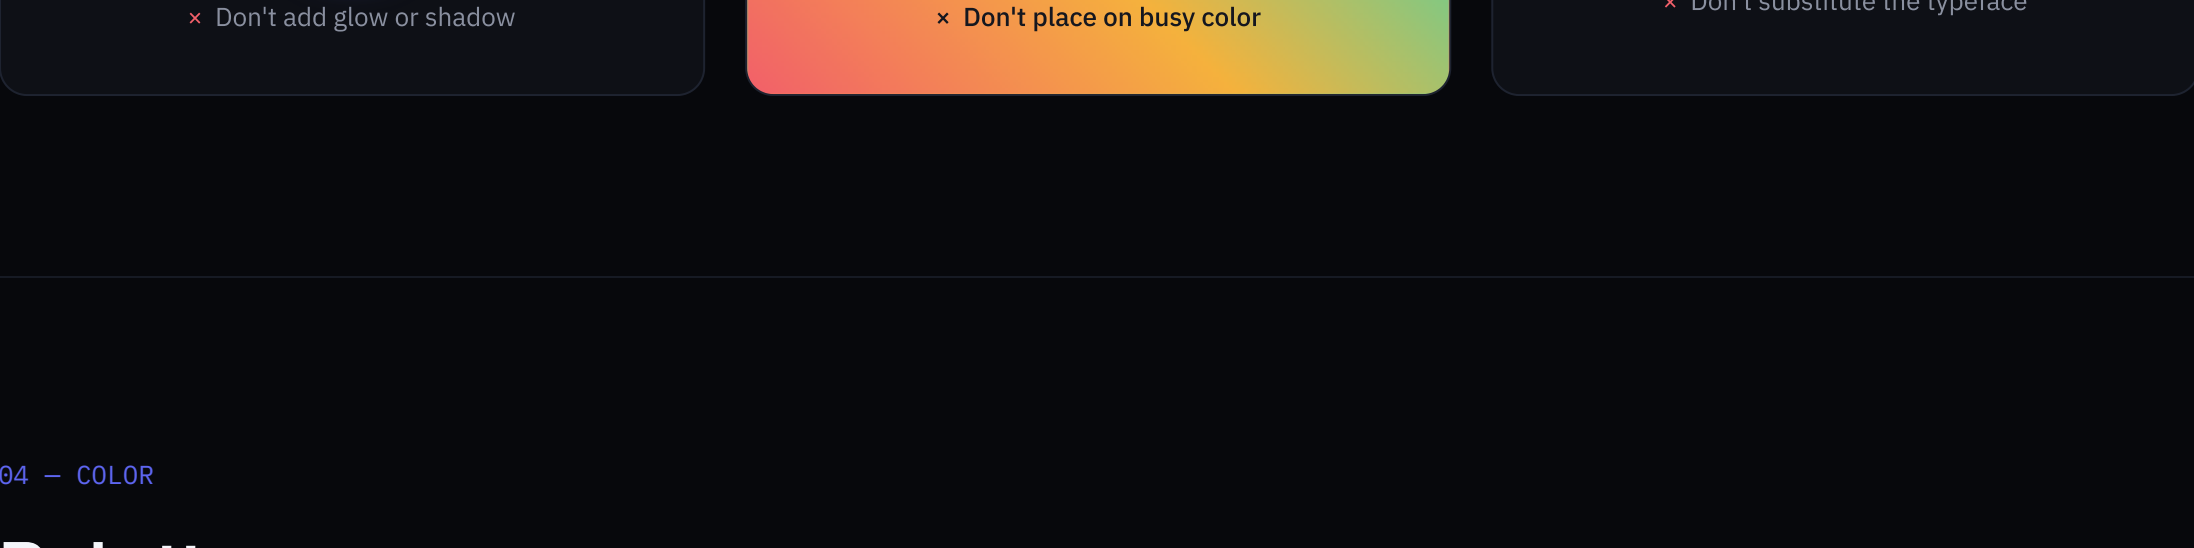

The mark

A rounded transaction tile holding a diagnostic pulse that resolves into a check — the product's whole job in one glyph: watch the transaction, surface the problem, confirm the fix. Geometric and balanced so it stays legible at favicon size and confident at scale.

03 — MISUSE

Don't do this

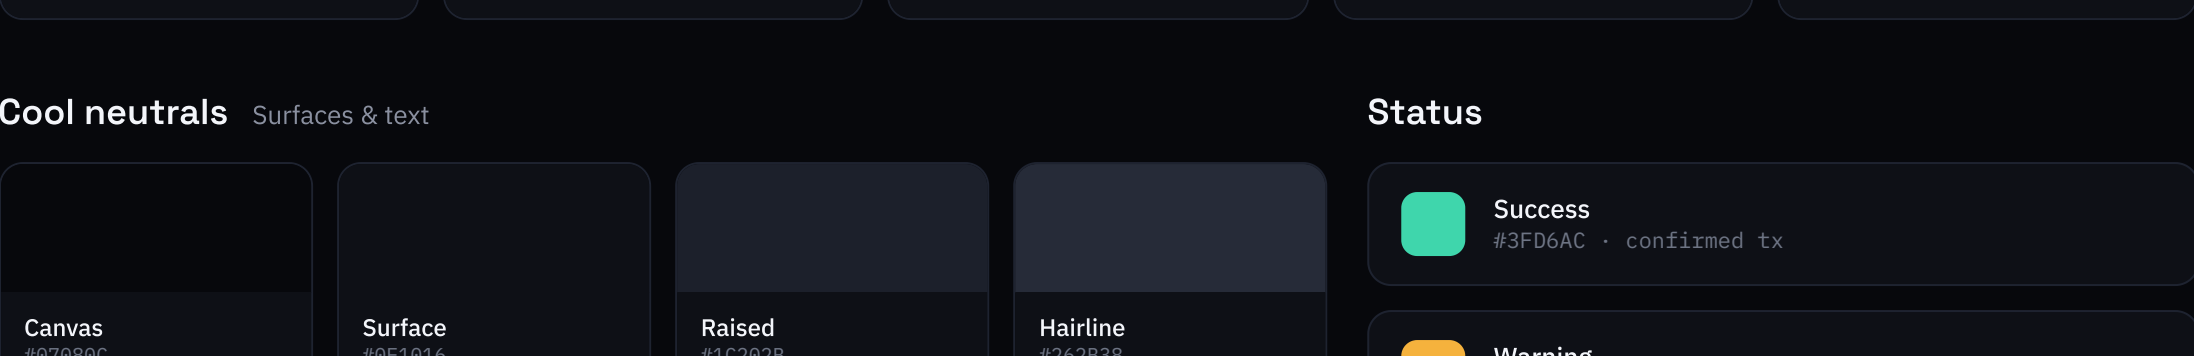

04 — COLOR

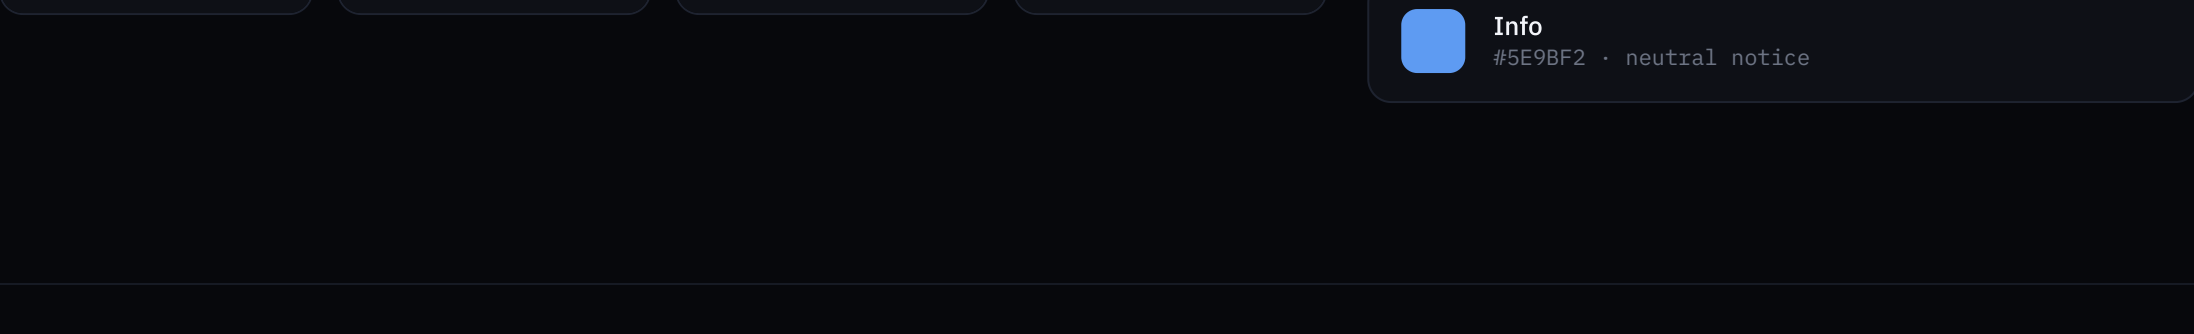

Palette

Iris carries the brand and every primary action. Verify-teal is reserved — it only ever means "confirmed / resolved." Everything else is a disciplined cool-neutral dark ramp so embedded UI never fights the host.

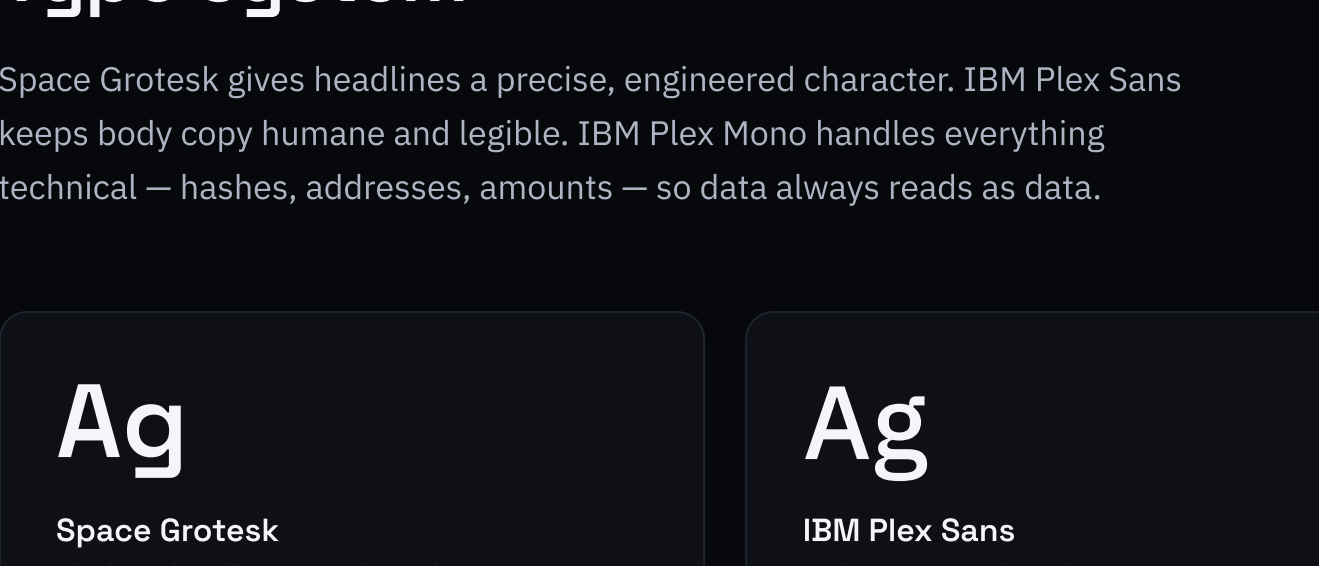

Iris Primary — brand & actions

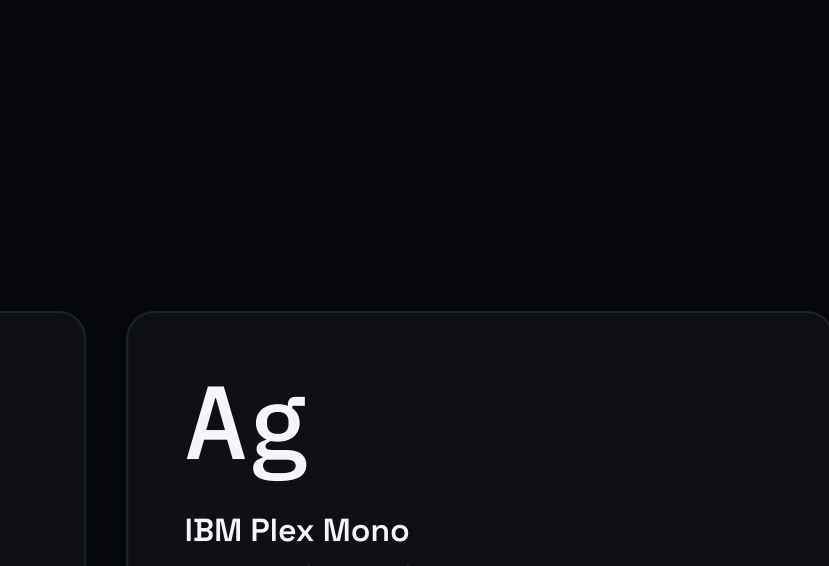

Verify Confirmed & resolved states only

Cool neutrals Surfaces & text

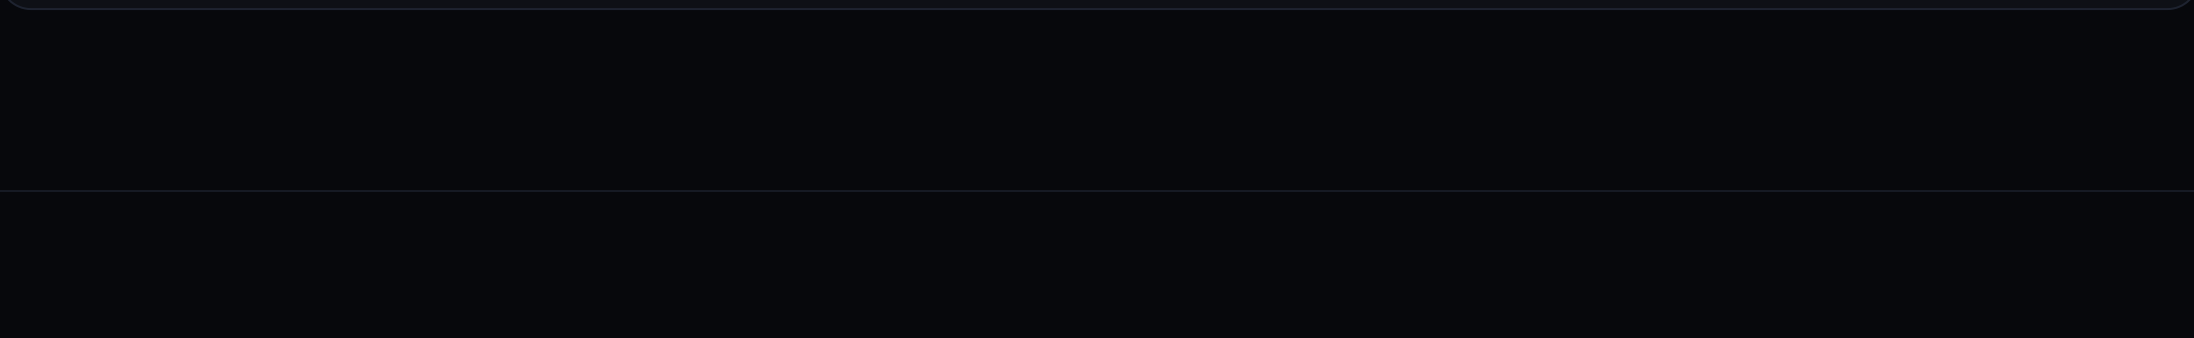

Status

05 — TYPOGRAPHY

Type system

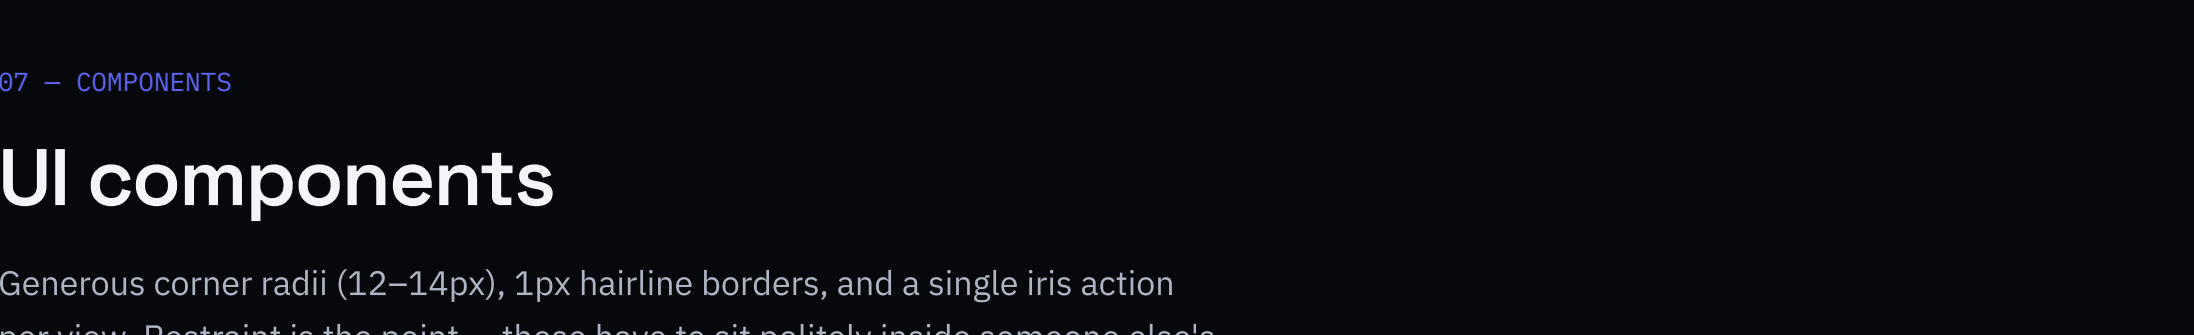

Space Grotesk gives headlines a precise, engineered character. IBM Plex Sans keeps body copy humane and legible. IBM Plex Mono handles everything technical — hashes, addresses, amounts — so data always reads as data.

06 — ICONOGRAPHY

Icons

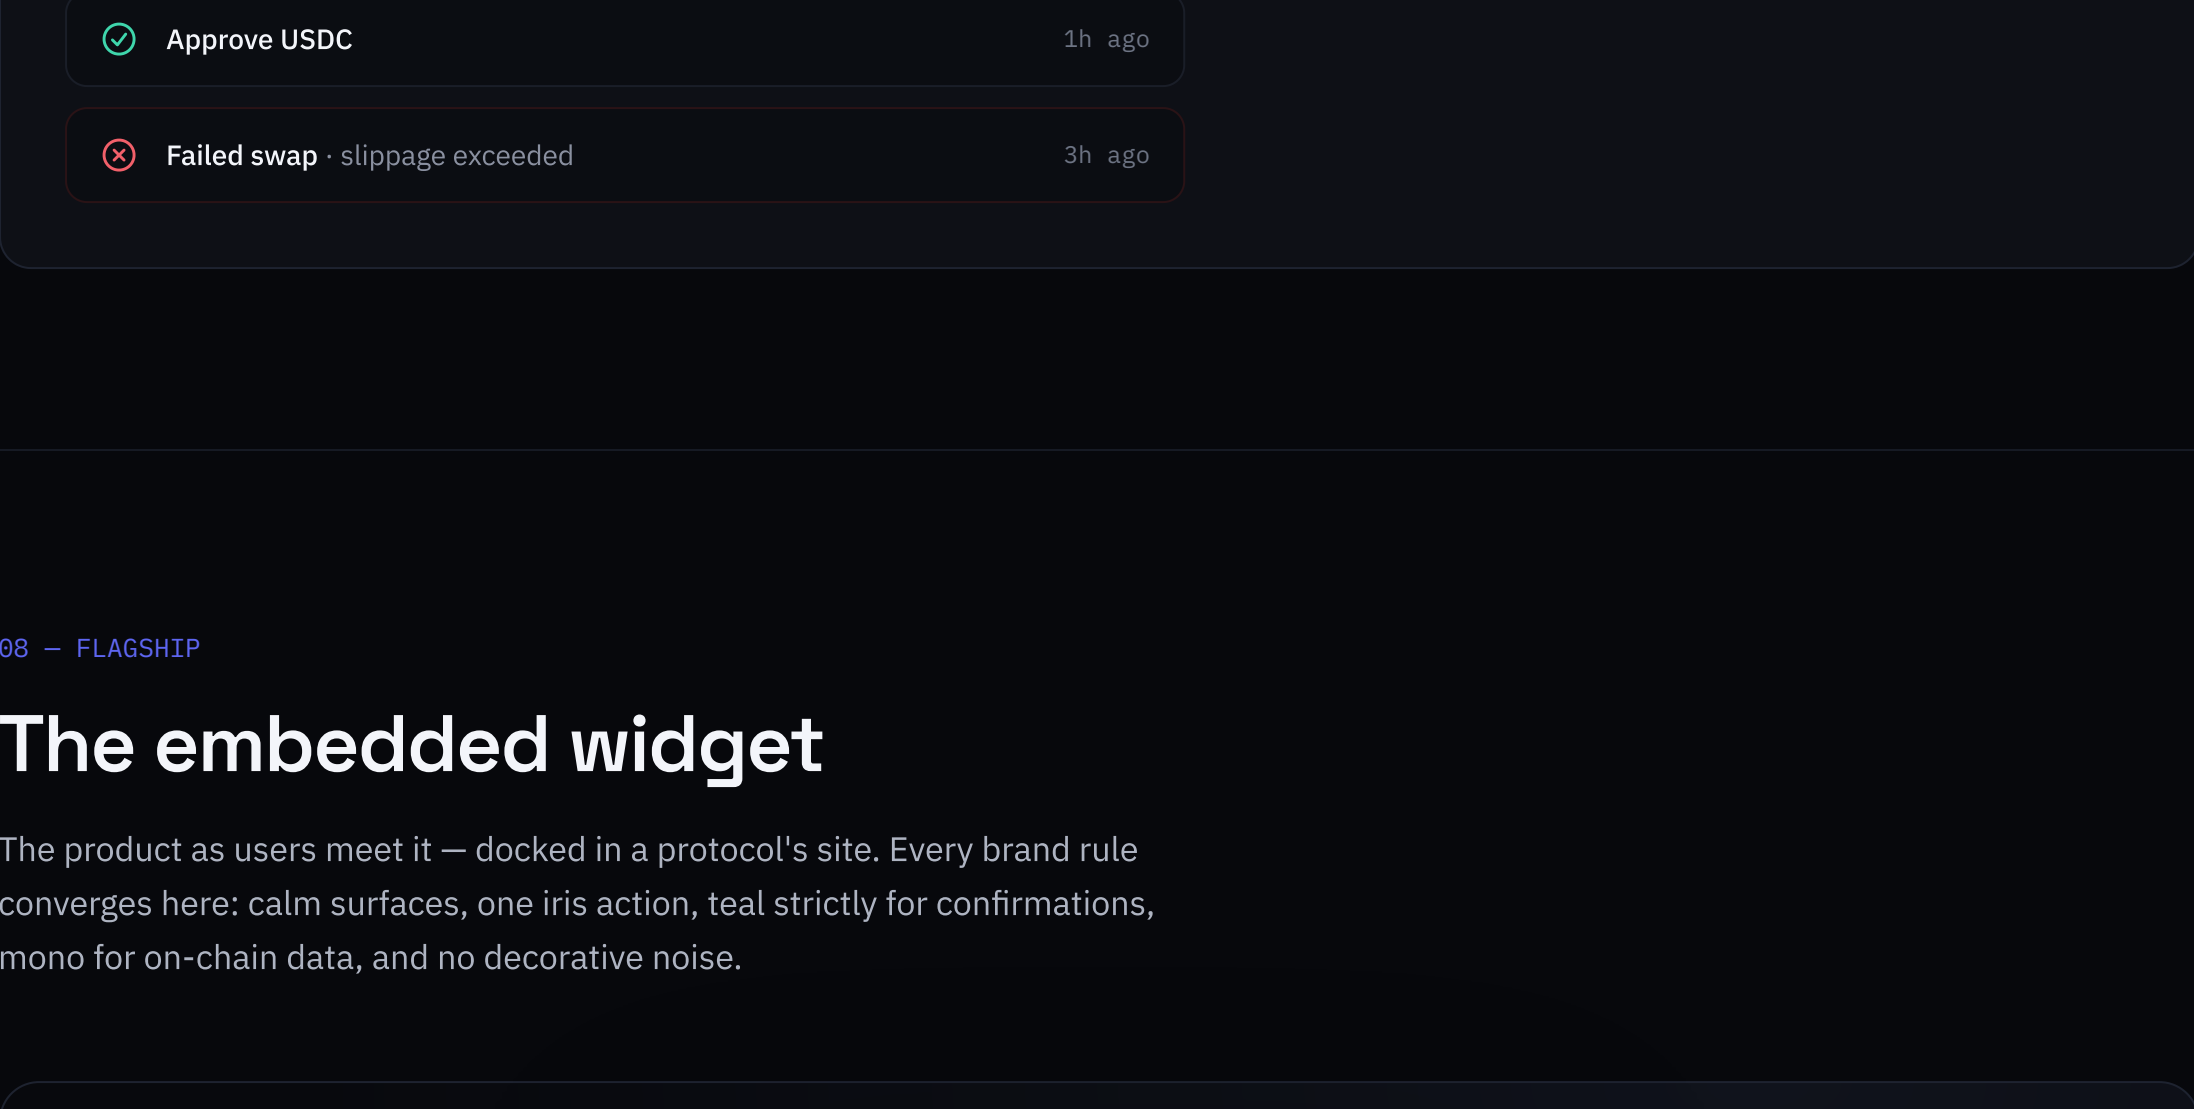

Line icons on a 24px grid, 1.75px stroke, rounded joins. Outline by default; fill only to signal an active or confirmed state.

07 — COMPONENTS

UI components

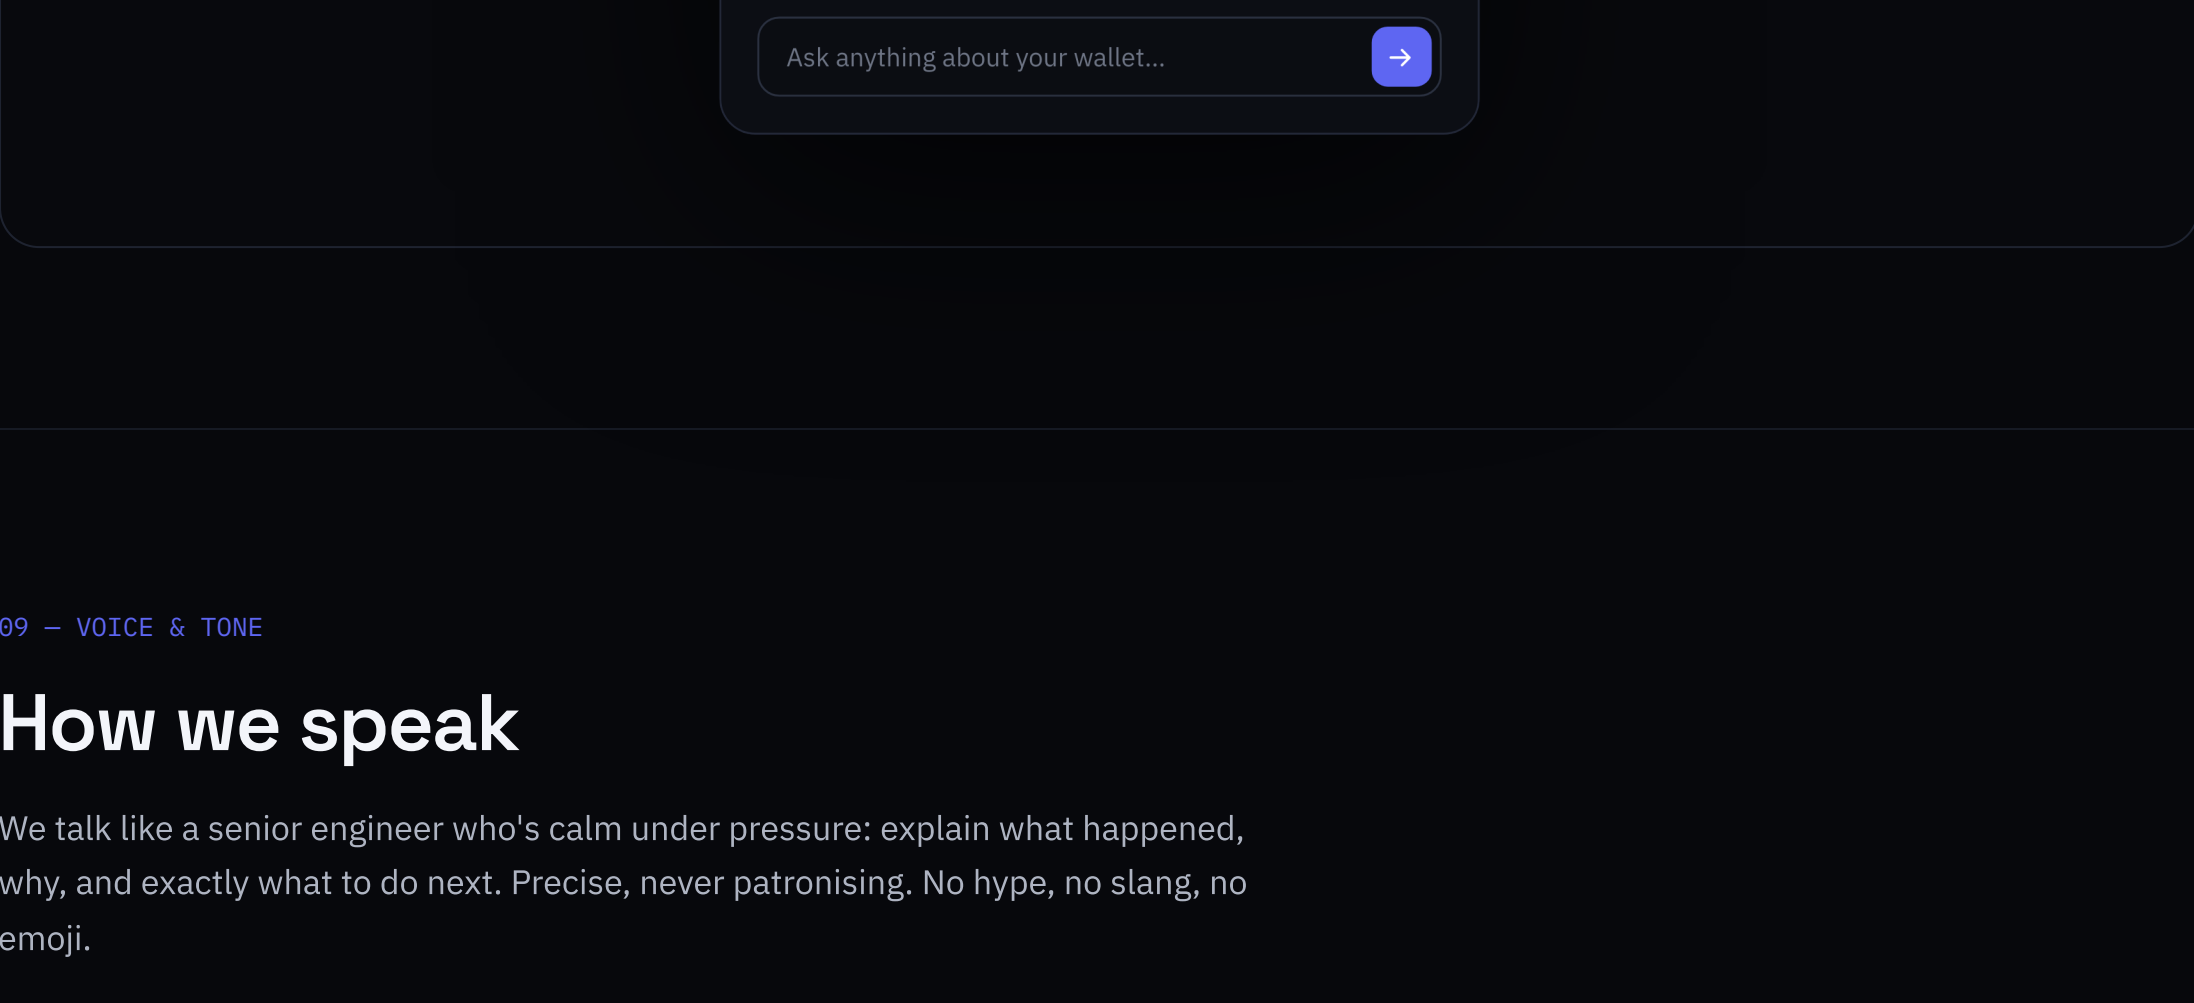

Generous corner radii (12–14px), 1px hairline borders, and a single iris action per view. Restraint is the point — these have to sit politely inside someone else's interface.

08 — FLAGSHIP

The embedded widget

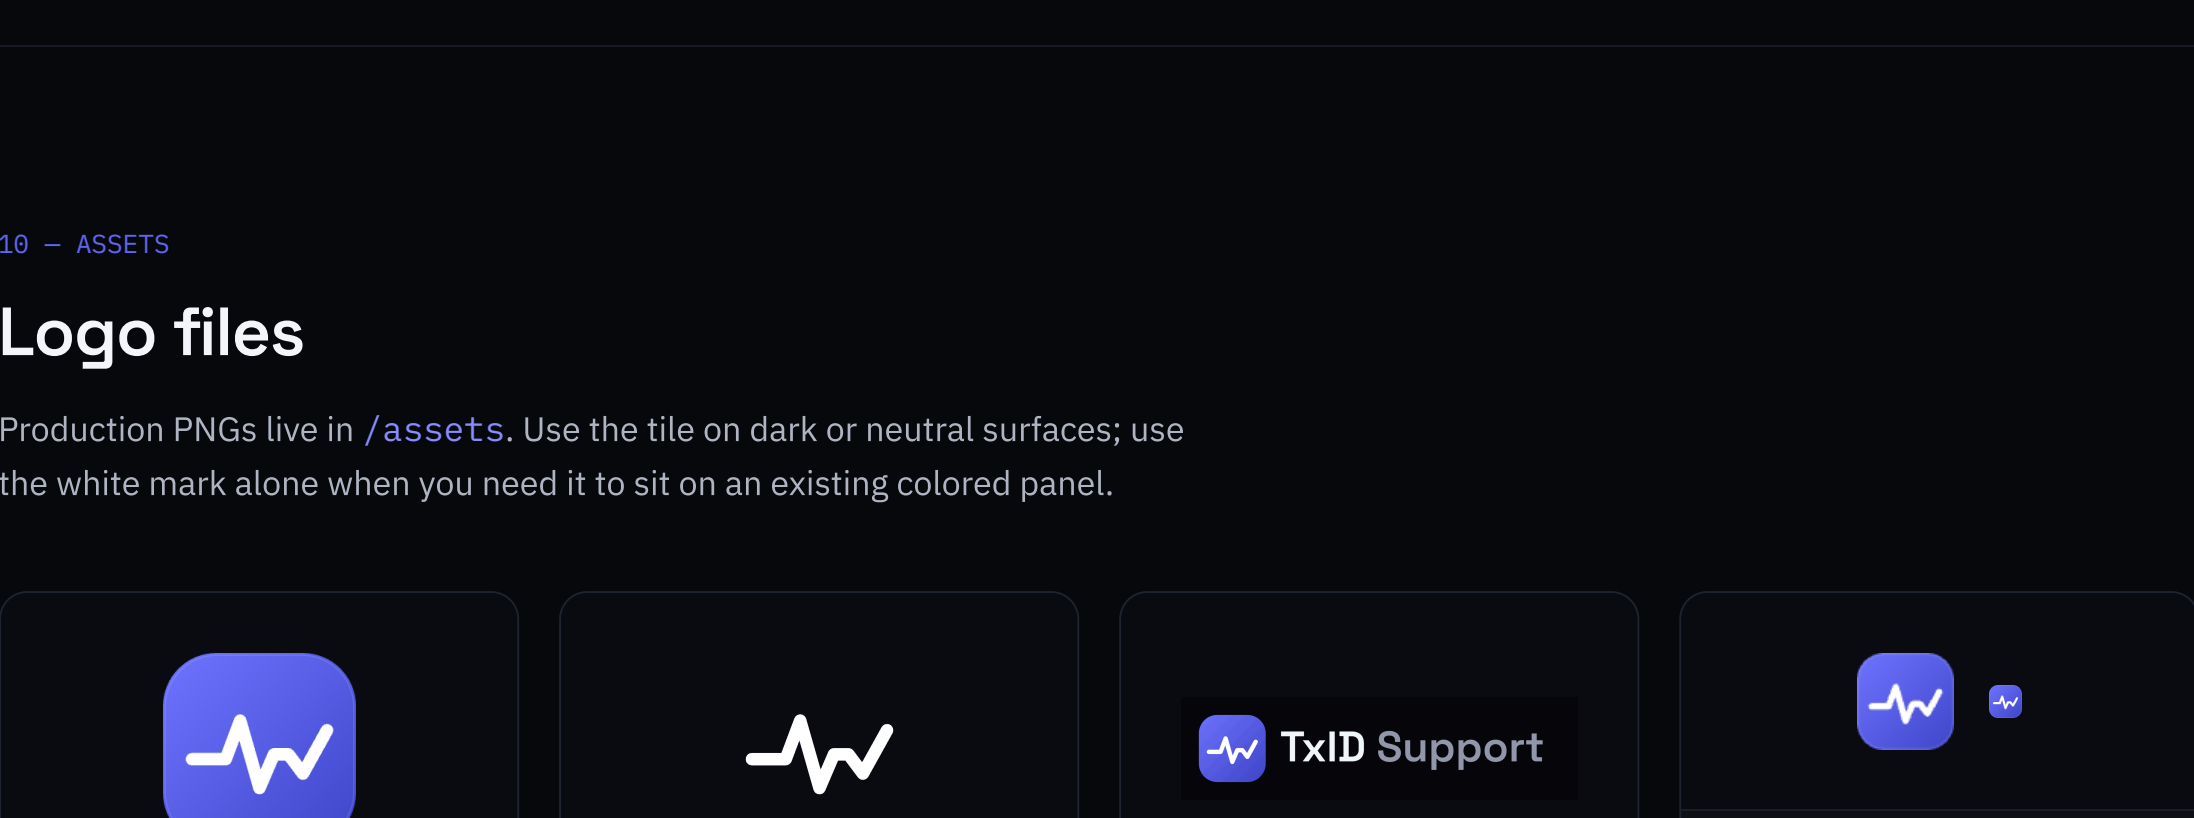

The product as users meet it — docked in a protocol's site. Every brand rule converges here: calm surfaces, one iris action, teal strictly for confirmations, mono for on-chain data, and no decorative noise.

09 — VOICE & TONE

How we speak

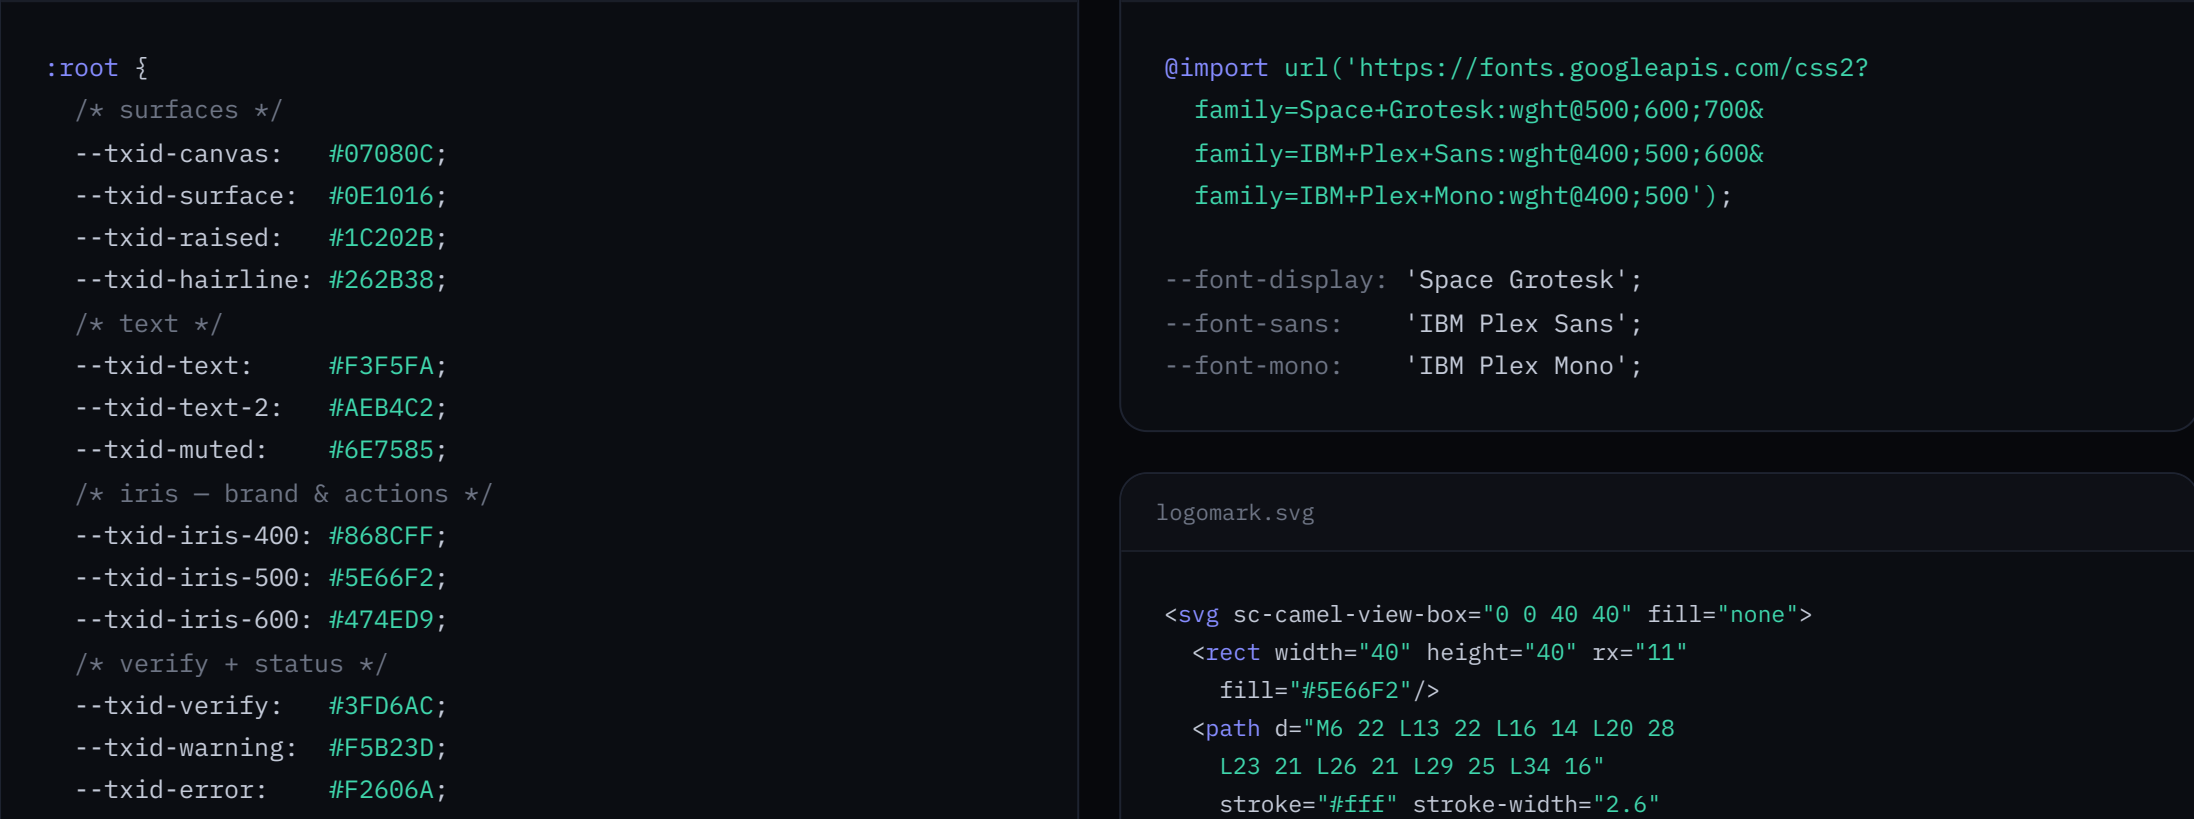

We talk like a senior engineer who's calm under pressure; explain what happened, why, and exactly what to do next. Precise, never patronising. No hype, no slang, no emoji.

10 — ASSETS

Logo files

Production PNGs live in /assets/. Use the tile on dark or neutral surfaces; use the white mark alone when you need it to sit on an existing colored panel.

11 — DEVELOPER HANDOFF

Tokens & snippets

Drop-in values for implementation. Names map 1:1 to the swatches above.
